

AI.FIT participant information sheet and informed consent form

Study title: Evaluating AI.FIT, a fitness dropout risk application

Researcher: Swetha Suresh

Programme/department: Computer Science (Technology Department)

Supervisor: Mr Yip See Wai

Researcher contact: suresh013@mymail.sim.edu.sg

Version/date: Version 3.0, 25 August 2026

Invitation

You are invited to take part in a study evaluating AI.FIT. Before agreeing to take part, please read this information carefully. You may ask questions before deciding. Taking part is voluntary. Choosing not to take part will not disadvantage you in any way.

What is the purpose of the study?

AI.FIT is a web application designed to help users stay consistent with their fitness journey. It uses a short voice entry and a meal photograph as information to analyse dropout risk. The voice entry is converted into a transcript and analysed for emotional signals associated with dropout risk. Three food readings will be given to the user to choose from and the food readings will be assigned a balanced, mixed or poor band using a project-specific application rule. The results are combined into a low, medium or high dropout risk level and recommendations are given accordingly.

This study evaluates the usability of the prototype. It is an undergraduate final year Computer Science project and is not a medical study. The study will take one week to complete.

Why have I been invited?

You have been invited because you are an adult who fits the target audience of the application and you can try this application and give feedback about its usability.

What will happen if I take part?

The activity you complete will be identified before you begin. Depending on the activity, you may

- write example check-in sentences for evaluation of the emotional signal models
- independently read the 36 Objective 2 entries about fitness and meal cases and record a low, medium or high risk judgement
- use AI.FIT on your own device for one week and complete check-ins using the voice entry and meal photograph, review the transcript, food readings, nutrition band, risk level and recommendations. Correct a result if you wish and complete a short Google Form which will include a System Usability Scale questionnaire and optional feedback you would like to give.

The Objective 2 voice recordings were generated from the written journals using a Windows system voice. They do not contain a participant's real voice. The written journal text and the generated audio are used only for the stated evaluation.

You will only be asked to complete the activities listed on the consent form. Do not include names, addresses, medical information or information about another person in a voice entry or photograph.

Do I have to take part and can I withdraw?

No. Taking part is entirely voluntary. You may refuse to answer any question and may stop at any time without giving a reason. You may ask for your identifiable study data to be deleted until 20 September 2026. After data has been fully anonymised and put into a statistical summary, it may not be possible to remove your contribution.

Possible disadvantages and risks

The study is expected to involve minimal risk. You may find that a model produces an incorrect transcript, food reading, nutrition band or risk level. AI.FIT is not a medical tool and must not be used for diagnosis or treatment. You may stop using the application or skip any task that makes you uncomfortable. The study does not require you to disclose mental health information or to change your diet or exercise.

Voice recordings and photographs are personal data. They will be processed only for this study and are deleted after analysis. The application is designed not to retain raw audio or image uploads after processing. Please do not upload another person's voice or photograph.

Possible benefits

You may not receive a direct personal benefit. Your feedback may help identify usability problems and improve the design of this fitness support application.

Confidentiality and data protection

All information collected during the study will be treated confidentially. The study will collect only the information needed for evaluation. If a check-in is used during the study, its voice recording and meal photograph will be processed for the check-in and deleted after analysis. The application stores the resulting transcript, model readings and corrections only as required for the evaluation.

Your name and contact details will be stored separately from evaluation responses. Reports and presentations will use combined or anonymised results. No identifiable voice recording, photograph or quotation will be published without your permission. Data will be stored in a password protected account accessible only to the creator. It will be retained until 15 January 2027.

The application gives a dropout score and recommendations based on the risk level detected. These are not medical decisions. You can inspect the transcript and food readings, correct them and choose a meal band manually if you are not satisfied with the readings given by the food recognition model. You have the right to ask what personal data is held about you, request correction or deletion where applicable.

Use of results

Anonymised summary results may be used in the final year project report, video or repository if necessary. The results will not be used for marketing or commercial purposes. No identifiable information will be shared without your permission.

Contact and complaints

If you have questions or concerns, contact Swetha Suresh at suresh013@mymail.sim.edu.sg. Thank you for reading this information and considering if you want to take part in the study.

Informed consent form

Please tick one box for each statement.

Statement	Yes	No
I have read and understood the AI.FIT participant information sheet dated [enter today's date].	☐	☐
I have had the opportunity to ask questions and received satisfactory answers.	☐	☐
I understand that taking part is voluntary and that I may stop or withdraw without giving a reason.	☐	☐
I understand that I will use the AI.FIT prototype and complete a usability form.	☐	☐
I consent to provide labelled written sentences for evaluation of the emotional signal models if this activity is selected.	☐	☐
I consent to my written evaluation text being converted into synthetic Windows system-voice audio for Objective 2 if this activity is selected.	☐	☐
I consent to provide independent risk judgements for the 36 Objective 2 cases if this activity is selected.	☐	☐
I consent to use AI.FIT for one week and upload check-ins to test the application usability.	☐	☐
I understand that voice recordings and meal photographs are personal data and will be deleted after analysis.	☐	☐
I understand that AI.FIT is not a medical tool and that its risk result is general fitness support.	☐	☐
I understand how my information will be stored, protected, used and deleted.	☐	☐
I consent to my anonymised answers and optional feedback being used in the project report and presentation.	☐	☐
I consent to anonymised summary results being retained for assessment and audit until 15 January 2027.	☐	☐
